### Objective

We report a case of alimentary tract duplication with antenatal rediagnosis of a retroperitoneal cystic mass.

### Methods

Case report.

### Results

We report a case of retroperitoneal cystic mass diagnosed in utero that ultimately proved to be alimentary tract duplication.

### Conclusion

Alimentary tract duplication represents a rare clinical condition whose diagnosis can only be established following surgery and histopathological analysis. The differential diagnosis includes a number of other rare cystic lesions, and detailed imaging is crucial to investigate and delineate the underlying pathology.
