University Clinic for Obstetrics and Gynecology, Skopje, FYROM

Objective
3-6% of all fetuses at term will be in a breech presentation. Facing this situation we deal with a lot of controversies related to the approach of delivery.

Methods
Aim: To evaluate all patients with breech presentation hospitalized and delivered at the University clinic for obstetrics and gynecology, in order to start a process of developing a standardized protocol for every day management of breech presentation.

Results
During year 2015 there were a total of 5557 deliveries in our institution, from which 3629 (65.31%) were vaginal deliveries and 1928 (34.69%) were cesarean sections. From the total number of deliveries 332 (5.9%) were fetuses in breech presentation. 87 (26.2%) were delivered vaginally and 245 (73.8%) with cesarean section. According to the parity 190 (57.22%) of women were primiparous and 142 (42.77%) were multiparous. The percentages of vaginal versus operative deliveries in these two groups were quite similar.

Conclusion
To evaluate the number of term pregnancies with fetuses in breech presentation and to promote the need of specialized institutional protocol for management and delivery of breech presentation.
