A case of neonatal hemochromatosis
Jeria R, Haye MT, Vasquez P, Sierra A, Guerra M, Gutierrez J
Hospital San José, Santiago, Chile

Objective
To report de efficacy of human immunoglobulins in the treatment of neonatal hemochromatosis in a public hospital at Santiago de Chile.

Methods
In a patient with previous new-born diagnosed with Neonatal Hemochromatosis, was administered 1gr per kilogram of human immunoglobulin weekly from week 18 to 38. Ultrasound follow up was made every 15 days to look for oligohydroamnios and intra uterine growth restriction.

Results
Delivery was scheduled at 38 weeks of pregnancy, obtaining a male new-born, 3200gr, Apgar score 9-9. With a favorable neonatal evolution. Periodic follow up didn’t show signs of hepatic injury, and with normal development, was discharged from follow up at 3 months of age. At 1 year 6 months of age, patient was recontrolled with a normal developement and no signs of hepatic injury.

Conclusion
High-Dose Human immunoglobullins could prevent the event of a new case of neonatal hemochromatosis if administered from week 18 till delivery.
