

Diagnostic algorithm and protocol for the management of fetal ascites

Eldarawi M, Eloraby N, Abdelaziz K.

MUST university hospital - 6th october city - Egypt, Cairo, Egypt

Objective

To create a protocol in the diagnosis and management of isolated fetal ascites.

Methods

This study was performed in MUST University Teaching Hospital from March 2013 to August 2016. working these cases in a tertiary referral unit in must then re examination of the neonates after pregnancy termination, this study included 1127 cases.

Results

Full diagnostic algorithm to manage such cases is defined with suggested protocol of management in all fetal medicine units.

Conclusion

Isolated fetal ascites remains a dilemma which can be managed in a successful way to get good perinatal outcome.
